

## One Place Food Ordering Website

### 1. Introduction

I have proposed online food ordering system on the ideation report. However, I decided to change the project to this one I am going to propose.

The website will list foods categorized by different ethnicities and different types of food just like Netflix.

For each item on the list there will be photos, descriptions, selection of the places to order, delivery option, feedbacks and ratings. The customer can order from the list of place by choosing a restaurant of their preferences

Once the order is placed from this website, the customer's order information is relayed to the appropriate restaurant where it can be served.

2. UI will be like Netflix User Interface where Genre will be Ethnicity and the list of the foods will be listed under each category. For each food once expanded will give all the information aforementioned. For initial phase, there will be only a couple of food items for each categories. This could expand and also the website could take the order for the restaurant and even deliver for them, but now it only list where it could purchased and the price range.

3. First the user has option of registering with the site and indicate some preferences. Also Search box is there to search for the specific food. Also List of foods will be presented to the customer under different categories. Customer can review many different foods before making a choice. Initially this will be just listing the place Where the customer can order; however, in the later enhancement the website will Take the order for the vendors and even process the payment

4. Amazon.com, Netflix.com,
